Acknowledgements

This document was prepared under the direction of the New Mexico Human Services Department (HSD) Behavioral Health Services Division (BHSD) Office of Substance Abuse Prevention (OSAP), and guidance of the Statewide Epidemiological and Outcomes Workgroup, by Coop Consulting, Inc.. It was supported by an award to the New Mexico Human Service Department, Behavioral Health Services Division, Office of Substance Abuse Prevention from the federal Substance Abuse and Mental Health Services Administration (SAMHSA) and managed by Synectics.

Special thanks is given to the New Mexico Department of Health (NM DOH), Epidemiology and Response Division (ERD) Substance Abuse Epidemiology Program and their tireless work updating the Statewide Substance Abuse Epidemiological Profile, and the NM DOH ERD Survey Unit’s equally ambitious work on the Youth Risk and Resiliency Survey. This document would not have been possible without their data, efforts, and input along the way.

Additionally, the members and participants of the Statewide Epidemiological and Outcomes Workgroup (SEOW) provided valuable and insightful feedback and recommendations to strengthen this County level profile. Every member is owed many thanks!

Lastly, the staff at HSD BHSD OSAP have provided enormous support for this project and invaluable suggestions and additions. Special thanks go to Karen Cheman, Pamela Espinoza, Harrison Kinney and Daphne Rood-Hopkins, who helped shape and inform the County level substance abuse epidemiological profiles.

This document can be accessed here: http://www.nmprevention.org/index.htm

Statewide Epidemiological and Outcomes Workgroup

The New Mexico Statewide Epidemiological and Outcomes Workgroup (SEOW) addresses behavioral health needs and supports state systems, schools, communities, and tribes in preventing substance abuse, dependency and related problems by identifying, collecting, analyzing and disseminating data that describes the prevalence, severity, consumption and consequences of alcohol, tobacco and other drug use in New Mexico.

Members include: Karen Cheman, Daphne-Rood Hopkins, Lelah Larson, Kim Horan, Nancy Michalk, Letty Rutledge and Sharon Ebert from HSD BHSD; Jim Roeber, Tierney Murphy, Dan Green and Nina Shah from NM DOH ERD; Glenn Wieringa from Traffic Safety Bureau; Martha Waller, Liz Lilliott and Lei Zhang from PIRE; Katherine Courtney from CYFD; Nadine Tafoya and Ann DelVecchio from the prevention community; Brenda Martinez from OptumHealth NM; Ron Lopez and Nancy Sanchez from the US Attorney’s office; and it is coordinated by Natalie Skogerboe and Michael Coop from Coop Consulting, Inc..

* Youth data from the Youth Risk and Resiliency Survey are not included in this report for Sandoval County. Due to small sample sizes, these data are not published by the New Mexico Department of Health for Sandoval County. Data comparing New Mexico youth and U.S. youth are included when they are available.
Context of New Mexico

When reviewing the data in this profile, it is important to understand the larger picture and the environmental factors that play a role in some of the negative findings. New Mexico is one of the poorest states in the country, and has a higher percentage of uninsured individuals than any state in the nation (according to 2009 US census data). Furthermore, many communities and populations in New Mexico have even higher poverty levels and higher rates of being uninsured.

Both of these factors have negative impacts on the health and safety of New Mexico communities. Poverty in the early years of a child’s life, more than at any other time, has especially harmful effects on healthy development and well-being. Early childhood poverty has been linked to negative outcomes later in a young person’s life, including teen pregnancy, substance abuse, and educational attainment.

People living in poverty and/or without adequate health insurance often experience delays in accessing health care and have an increased risk of chronic disease and death from disease and injury.

Sources
Introduction

This community profile is intended to be used as a resource for New Mexico communities for data related to substance use and abuse. The profile covers relevant substance abuse data from a variety of sources at the county, state, and national levels for both youth and adults whenever possible. The profile contains the following data:

- **Consumption Data** – Consumption is the way in which people use substances (i.e. binge drinking and cigarette use). Information on alcohol, tobacco and other drug use is included for adults and youth where available.

- **Consequence Data** – Consequences are the problems caused by substance use or abuse (e.g. alcohol-related injury or chronic disease). Information on negative outcomes associated with substance use among adults and youth is provided.

- **Resiliency and Risk Factor Data** – Resiliency or protective factors are the strengths and assets that help protect individuals and communities from substance use, abuse and other problems. Risk factors are the things that increase one’s risk for substance abuse and related problems. Information on factors that influence substance use for youth are provided.

- **Mental Health Data** – Mental health is often closely related to substance use and other problems, including chronic disease. Those who are depressed or report frequent mental distress or thoughts of suicide are also more likely to use substances in risky ways that those who do not have mental health concerns.

*These data are not available for Sandoval County

Demographics

Sandoval County is the 5th most populous county in the state with 131,561 people, and has experienced rapid growth over the past decade, according to 2010 US Census data. The median household income in Sandoval County is $57,378 and 11% of persons live below the federal poverty line, which is below the state percentage of 18.2%.

Sandoval County residents are primarily White (47.5%) and Hispanic (35.1%); followed by American Indians (12.9%), Blacks (2.1%) and Asians (1.5%). Compared to the US, Sandoval County has a higher percentage of Hispanics and American Indians but lower percentages of Blacks and Asians.

**Sandoval County Population Breakdown:**
- 50.9% Female
- 49.1% Male
- 6.7% Persons under 5yrs
- 26% Persons under 18yrs
- 11% Persons 65yrs and older

ALCOHOL USE & CONSEQUENCES

Alcohol consumption is the way in which people drink alcohol. According to the CDC ARDI system, 23% of suicide and 47% of homicide and a fraction of other violence such as domestic violence, crime, risky sexual behavior, falls and drug overdose are attributable to alcohol. Binge drinking is defined as having 5 or more drinks in one occasion, for men, or 4 or more drinks for women. Heavy drinking is defined as having more than 2 drinks per day for men, and more than one drink per day for females. Drinking and driving has been the focus of public health strategies in New Mexico over the past few decades. Great strides have been made and New Mexico has seen a 39% decrease in alcohol related motor vehicle crash deaths from 2004-2008, but alcohol is attributed to be the primary causal factor in nearly 45% of motor vehicle crash deaths among males aged 20-44.

SOURCE: 2011 New Mexico Substance Abuse Epidemiology Profile

Sandoval County has slightly higher prevalence of binge drinking than NM and slightly lower prevalence than the US. Despite these numbers, New Mexico suffers severe consequences for risky consumption.

ALCOHOL USE & CONSEQUENCES (continued)

Binge drinking is an important indicator because it is closely linked with other problems and consequences, including motor vehicle crashes, alcohol-related injury and injury deaths, and violence.

**ADULT Binge Drinking by Race/Ethnicity**

In Sandoval County, Whites and Hispanics have a similar prevalence of binge drinking and it is slightly lower than the US.

**ADULT Drinking and Driving (past 30 day) by Race/Ethnicity**

Drinking and driving is not reported very often; the sample size for Sandoval County was too small to include measures for most race/ethnicities.
ALCOHOL-RELATED DEATH

New Mexico suffers severe consequences from excessive alcohol use. The alcohol-related death rate has been among the highest in the nation for thirty years and has been the highest in the Nation since 1997. The main contributors to alcohol-related death in New Mexico are chronic disease and alcohol related injury.

SOURCE: 2011 New Mexico Substance Abuse Epidemiology Profile
**ALCOHOL-RELATED INJURY DEATH**

New Mexico’s death rate for alcohol-related injury is 1.8 times the national rate and has been among the worst in the nation for the past twenty years. Heavy drinking and binge drinking are high-risk behaviors associated with numerous injuries, including motor vehicle crash fatalities, falls, homicide and suicide. The leading cause of alcohol-related injury death is alcohol-related motor vehicle traffic crash (MVTC) deaths. Historically, New Mexico’s alcohol-related MVTC fatality rate has been the highest in the nation; however the rate has decreased 75% from 1982 to 2009 and fallen from 1st to 11th in the nation. This progress is attributable to a public health approach using a wide range of policy and preventive interventions.

**Alcohol-Related Injury Death by Race/Ethnicity**

<table>

**ALCOHOL-RELATED CHRONIC DISEASE DEATH**

Since 1996, New Mexico has had the first or second highest death rate from alcohol-related chronic disease in the nation, at 1.5 to 2 times the national rate. Behaviors that contribute to alcohol-related chronic disease include alcoholism and chronic heavy drinking. Alcohol-related chronic liver disease (CLD) is a progressive chronic disease in which liver cells are damaged and their capacity to regenerate is impaired. New Mexico has had the highest AR-CLD death rate in the nation since 1999 and CLD is the principle driver of high alcohol-related chronic disease death rates in the state.

**Alcohol-Related Chronic Disease Death by Race/Ethnicity**  
**NM BVRHS 2005-2009 & ARDI**

Sandoval County has a similar alcohol-related chronic disease death rate (21.9) as the rest of the state (23).

However, the alcohol-related chronic disease death rate for American Indians is 48.6, which is 4 times the US rate, and the rate for Hispanics is 26.5, which is 2.2 times the US rate.

**Alcohol-Related Chronic Liver Disease Death by Race/Ethnicity**  
**NM BVRHS 2005-2009**

Sandoval County’s overall CLD death rate is 1.8 times the US rate.

American Indians and Hispanics have among the highest alcohol-related chronic liver disease death rates in Sandoval County and the state overall.
CIGARETTE SMOKING & SMOKING RELATED DEATH

New Mexico has similar smoking patterns to the rest of the nation, and lower smoking related death rates. However, smoking related death rates in New Mexico are far higher than alcohol related death rates, chronic disease deaths and injuries. Smoking is linked with several chronic conditions, including chronic airway obstruction, lung cancer, ischemic heart disease, other heart disease and bronchitis and emphysema. Smoking takes a tremendous toll on the overall health of New Mexico residents as well as the health care systems in the state.

**SOURCE: 2011 New Mexico Substance Abuse Epidemiology Profile**

Adult smoking prevalence in Sandoval County is lower than the state and nation at 12.4%.

Sandoval County has a similar smoking related death rate as New Mexico and a lower rate than the rest of the U.S.

**SOURCE: 2011 New Mexico Substance Abuse Epidemiology Profile**

---

**--- indicates the data were excluded because there were fewer than 50 respondents, or fewer than 2 deaths per year, making rates unreliable**
DRUG-INDUCED DEATH

New Mexico has the highest drug-induced death rates in the nation. Drug use takes a large toll on New Mexico communities, including factors that contribute to crime and domestic violence. The largest subset of drug induced death, comprising more than 80% of all drug deaths in New Mexico, is unintentional overdose death. Overdose or poisoning (harmful effects of drugs from overdose or sensitivity) has become the leading unintentional injury death in New Mexico. The most common drug types causing death were heroin (38%), prescription opioid other than methadone (35%), cocaine (34%) and alcohol/drug combinations (27%).

Unintentional Drug Overdose Death (rate per 100,000)  

Sandoval County has a lower death rate from illicit drugs (5.1) and prescription drugs (5.5) than the rest of the state.

Prescription drug misuse is closely tied to other opioid abuse (such as heroin).

Unintentional Drug Overdose Death by Sex (rate per 100,000)  

Males are more likely to suffer a drug-induced death than females in Sandoval County, and the state in general.

Drug-Induced Death Number & Rate by Ethnicity  

Sandoval County has a lower death rate from illicit drugs (5.1) and prescription drugs (5.5) than the rest of the state.

Prescription drug misuse is closely tied to other opioid abuse (such as heroin).

Unintentional Drug Overdose Death Number & Rate by Sex  

-- indicates the data were excluded because there were fewer than 2 deaths per year, making rates unreliable.
YOUTH SUBSTANCE USE

Sandoval County’s Epi Profile does not contain county-specific data because not enough data were collected in the county through the YRRS for the NM Department of Health to publish a report.

New Mexico has consistently led the nation in youth alcohol and drug use. According to the 2009 New Mexico High School Youth Risk and Resiliency Survey (YRRS) and National Youth Risk Behavior Survey (YRBS), New Mexico ranks first in the nation for the following measures:

- First drink before age 13
- Drank on school property
- Used marijuana before age 13
- Current marijuana use
- Ever used cocaine
- Current cocaine use
- Ever used ecstasy
- Current cigar use

Early initiation (starting to use substances at an early age) is a big concern for New Mexico, because research shows that the earlier youth start drinking alcohol, the more likely they are to experience alcohol dependence and other negative consequences later in life.

**Current Alcohol Use (past 30 day) Grades 6-12**

Current alcohol and marijuana use increases with age in New Mexico.

**Current Marijuana Use (past 30 day) Grades 6-12**
The graph below shows the current substance use (within the past 30 days) of high school students. According to the 2009 New Mexico YRRS, binge drinkers were also more likely than non-drinkers to report persistent feelings of sadness or hopelessness and attempt suicide.

Compared to youth in the rest of the nation, New Mexico youth have a higher prevalence of marijuana, cigarette use, ecstasy, cocaine and heroin use.

*US percentages for Ecstasy, Inhalants, Meth, and Heroin are lifetime use (data not available for current/past 30 day use).
YOUTH RISK & RESILIENCY MEASURES

Risk factors are those things in a community that increase the likelihood of substance abuse and related problems. Resiliency or protective factors are characteristics that decrease the risk of substance abuse and their problems or consequences. Researchers have determined that the more resiliency and protective factors an individual person or community has, the more protected they are from those behaviors that are potentially damaging. Prevention programs seek to enhance resiliency/protective factors, and reverse, reduce, or buffer against the effects of risk factors. It is important to know there are many factors that influence whether a person engages in high risk behavior such as Alcohol, Tobacco, or Other Drug (ATOD) misuse and/or abuse. Comprehensive, evidence-based prevention strategies address risk and create protective factors for individuals, families, schools, and community.

NM Students least likely to use alcohol were students with the following resiliency factors:

- Those with high levels of caring and support from parents, teachers, and other adults in the community.
- Those who completed their homework and came prepared to class.
- Those who did not engage in violent behaviors.
- Those who did not engage in tobacco or drug use.

SOURCE: Alcohol-Related Behaviors Among New Mexican Youth, 2009 YRRS; www.youthrisk.org

YOUTH MENTAL HEALTH

Mental Health among youth in New Mexico has been among the worst in the nation since 2003. Mental health problems among youth are linked with substance use, poor academic performance and other risky behaviors, as well as overall health issues. 2009 YRRS data reveals that current alcohol drinkers and current binge drinkers were more likely to report persistent feelings of sadness or hopelessness and attempt suicide than non-drinkers. Persistent feelings of hopelessness or sadness, described as feeling sad or hopeless almost every day for two or more weeks so that regular activities were stopped, are a risk factor for depression.

High School Suicide Ideation & Attempts (Grade 9-12)  NM YRRS 2009

New Mexico youth have a slightly higher prevalence of mental health concerns than youth in the rest of the U.S.
ADULT MENTAL HEALTH

Poor mental health is a serious and persistent public health concern in New Mexico communities. Depression is one of the most prevalent and treatable mental disorders in the state and is a risk factor for suicide and attempted suicide and is often associated with substance abuse. In addition, depression has been associated with an increased prevalence of chronic medical conditions, such as heart disease, stroke, asthma, cancer, diabetes and obesity (NM DOH Report 2008, T. Murphy).

ADULT Depression and Frequent Mental Distress

Sandoval County residents (7.4%) have a slightly lower prevalence of current depression than New Mexico residents (9.3%) overall.

Sandoval County residents report a similar prevalence of frequent mental distress as the rest of New Mexico and the Nation.

Suicide Death (Rates per 100,000)

Sandoval County residents (14.2) have a lower rate of suicide death than New Mexico residents (17.9) overall. The county rate is 1.3 times the U.S. rate for suicide death.

New Mexico’s suicide rate has consistently been 1.5 to 1.9 times the U.S. rate since 1981, and has been in the top 5 states for almost all of those years as well. For the state overall, male suicide rates are more than three times female rates.
**DATA SOURCES**

New Mexico is fortunate to have a 2011 Statewide Substance Abuse Epidemiology Profile that has been compiled and updated through the statewide Strategic Prevention Framework State Incentive Grant and other funds. The 2011 Statewide Substance Abuse Epidemiology Profile was prepared by the New Mexico Department of Health Epidemiology and Response Division. That document provided the bulk of the data for this county profile, which was prepared by Coop Consulting, Inc. under the direction of the New Mexico Human Services Department Office of Substance Abuse Prevention and guidance of the Statewide Epidemiological & Outcomes Workgroup. It was supported by an award to the New Mexico Human Service Department Office of Substance Abuse Prevention from the federal Substance Abuse and Mental Health Services Administration.

LIMITATIONS

This community level profile is based upon the data that were available for substance use/abuse, resiliency and consequences for New Mexico. Many gaps exist. Limitations include the use of national/state surveys which are not well known for asking questions or collecting data in culturally sensitive manners. The survey data that are used (BRFSS & YRRS) are self-reported and can reflect recall bias or social desirability response bias. Additionally, both of these surveys have limitations in regard to reach; the YRRS data are not available for every county, the BRFSS has very small sample sizes for American Indians and for some counties so that rates/percentages cannot always be determined. The New Mexico Statewide Epidemiological Workgroup wanted to include resiliency factors and data that reflect many of the unique strengths and protective factors in communities. Unfortunately, much of these data are non-existent or not published for public use in aggregate forms. Finally, there is a need for a cost study to determine the true cost of substance abuse in New Mexico. Despite these limitations, this profile can serve as a platform for addressing data gaps and for discussions about substance related issues in New Mexico communities.

CONCLUSIONS

This county epidemiological profile reveals the great toll that substance abuse takes on New Mexico communities. New Mexico leads the nation in alcohol-related death and alcohol-related chronic disease as well as drug-induced death. During the past two decades New Mexico’s drug-induced death rate has almost tripled. This is a trend that needs to change.

New Mexico cannot afford to lead the nation in substance related problems.

Evidence based substance abuse prevention programs and initiatives that have used a public health approach have had a substantial impact on alcohol-related motor vehicle crash fatalities, reducing alcohol related motor vehicle fatalities by more than a third over a five-year period. The state could make similar progress in other areas if prevention were a significant priority within state and community systems.

Additionally, these data reveal the need to address the unique needs and disparities among minorities and other groups in New Mexico. The state and community groups need to improve access to high quality prevention services and increase cultural sensitivity to Hispanics and American Indians.

It is critical that our state and community systems address the overall health and wellbeing of individuals, families and communities. Research continues to reveal close ties between mental, physical and behavioral health. Our systems need to address the mental and emotional wellbeing of residents in order to have a positive impact on substance abuse problems and related chronic health conditions.
